

2)

Encontre a descrição por equação diferencial para o sistema descrito no diagrama de blocos abaixo:

$$\begin{cases} y(t) = 2f(t) + f^{(1)}(t) & (A) \\ f'(t) = -3f^{(2)}(t) + u(t) & (B) \end{cases}$$

Derivando A

Derivando B

$$\begin{aligned} 1^a) y'(t) &= 2f'(t) + f(t) & (A_1) & \quad 1^a) f'(t) = -3f^{(1)}(t) + u'(t) & (B_1) \\ 2^a) y''(t) &= 2f''(t) + f'(t) & (A_2) & \quad 2^a) f''(t) = -3f(t) + u''(t) & (B_2) \end{aligned}$$

A partir de (A) e (B<sub>1</sub>)

$$\Rightarrow y(t) = 2f(t) - \frac{1}{3} [f'(t) - u'(t)]$$

$$y(t) = \frac{1}{3} u'(t) = [2f(t) - \frac{1}{3} f'(t)] \quad (C)$$

A partir de (A<sub>2</sub>) e (B<sub>2</sub>)

$$\begin{aligned} \Rightarrow y''(t) &= 2[-3f(t) + u''(t)] + f'(t) \\ &= -6f(t) + 2u''(t) + f'(t) \end{aligned}$$

$$y''(t) = 2u''(t) - 3 \underbrace{\left[ 2f(t) - \frac{1}{3} f'(t) \right]}_{(C)}$$

$$y''(t) = 2u''(t) - 3 \left[ y(t) - \frac{1}{3} u'(t) \right]$$

$$\boxed{\therefore y'' + 3y = 2u'' + u'}$$
